

JoFlights Project

Hi, This is My Backend Project to create a Flight Booking Website Using Laravel Framework in the local host, namely JoFlights with my other friends.

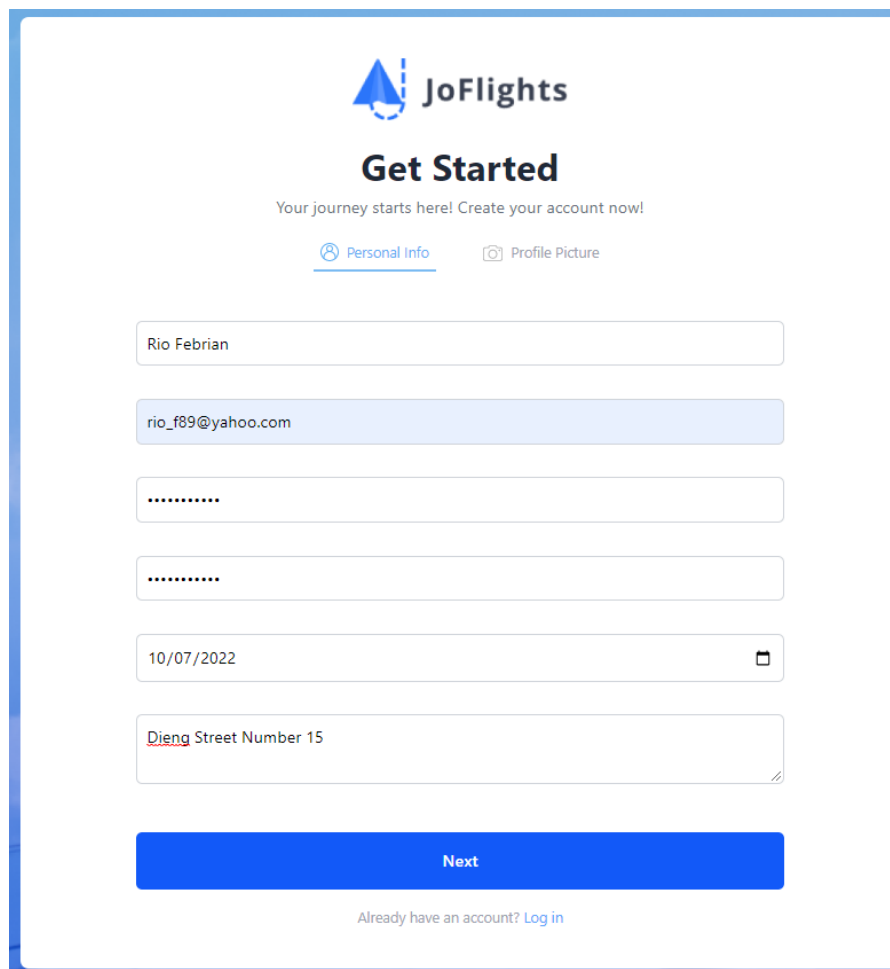

Preview:

(This is the landing page before login)

The image shows a preview of the JoFlights landing page. At the top, there is a navigation bar with the JoFlights logo, the text "Book your flight right from seat", and links for "Check Order", "Log in", and "Register". Below the navigation bar is a large blue banner with the text "Monday Special Deals" and "Discount up to IDR 300K". Underneath the banner is a white search form titled "Where would you like to go?". The form includes fields for "From" (with a search icon), "To" (with a search icon), "Passengers" (with a dropdown menu showing "Adult" and "Child"), "Departure Date" (with a date picker icon), and "Seat Class" (with a search icon). A blue "Book Now" button is located at the bottom right of the search form.

Register Page

The image shows the JoFlights registration page. At the top, there is the JoFlights logo and the text "Get Started". Below this is the text "Your journey starts here! Create your account now!". There are two tabs: "Personal Info" (selected) and "Profile Picture". The "Personal Info" tab contains several input fields: a text field for "Name" (filled with "Rio Febrian"), a text field for "Email" (filled with "rio_f89@yahoo.com"), a password field (filled with "*****"), a confirm password field (filled with "*****"), a date field for "Date of Birth" (filled with "10/07/2022"), and a text area for "Address" (filled with "Dieng Street Number 15"). A blue "Next" button is located at the bottom of the form. Below the button is the text "Already have an account? Log in".

The Booking Page (After Login Using Middleware and Auth From Laravel)

JoFlights

Check Order

Going anywhere?
JoFlights is the answer!

JoFlights provides an enjoyable experience of booking flights. With a single-click from your couch, you are ready to fly to your destination! We provide various flights from various trusted flights companies to provide you a safe and enjoyable flights.

If you want to check the full display:

1. Clone the GitHub project
2. Copy .env.example to .env (can use command in terminal)
3. Make Sure your PHP version is 7.2.5 (I create the project when laravel version is 7)
4. Start apache and PHP MySQL admin in Xampp
5. Change .env DB_DATABASE to the required name and create a new database name in MySQL based on the previous name.

On Terminal :

6. composer install
7. php artisan key:generate
8. php artisan migrate
9. php artisan serve
10. I think you need npm and laravel/ui:2.0 to run the authentication from laravel
